

Why we should oppose TransCanada's Keystone XL Pipeline:

- 1. TransCanada does not care about landowners:** They have coerced families into signing fraudulent contracts and used eminent domain to take their land by force.

A story from East Texas:

Grandmother and Texas landowner, Susan Scott has fought TransCanada for 4 years. She was unable to make an informed decision on TransCanada's contract, which falsely described the pipeline as transporting crude oil, and not diluted bitumen (toxic tar sands). Susan was bullied into signing with TransCanada after threats of land seizure by eminent domain.

- 2. The pipeline threatens our health:** Toxic tar sands are corrosive and spill more often than crude. Spills are too difficult to cleanup. TransCanada's pipeline threatens the health of millions.

The worst spill in Michigan:

U.S. pipeline company Enbridge is responsible for the worst tar sands spill in North America--and its total cover-up. Despite the warning signs, Enbridge allowed about one million gallons of toxic tar sands to spill in the Kalamazoo river. Over 200 people became sick, and the river's fish all died. Enbridge paid for people's silence and literally buried the spill.

Why we should oppose TransCanada's Keystone XL Pipeline:

- 3.** **TransCanada has no integrity:** They lie to landowners, indigenous communities, and regulators. TransCanada is a corporation that cannot be trusted with our communities' safety.

Lies from TransCanada:

TransCanada has repeatedly lied about the contents of their pipeline. They claim it will transport crude oil, but we know that it will contain toxic tar sands. The contents of TransCanada's pipelines are kept secret, even to regulators after dozens of uncleaned toxic spills. TransCanada lies to indigenous communities, and tramples their land and burial grounds.

- 4.** **Tar sands extraction is the most destructive plan on Earth:** It produces four-times the carbon emissions as compared to crude oil. It will destroy a forest the size of NY state.

Story of Canada's ancient forests:

Tar sands exploitation has already destroyed 170,000 acres of ancient forest in Canada. There is no hope for regrowth. With tar sands, Canada has no plan to comply with the carbon reduction agreements they signed, and their emissions will only make our climate crisis much, much worse.
